

Wildshot Operator — Quick Card

The one-glance operator reference — derived digest, snapshot 2026-07-30. Planning docs + Decision Deck win on any conflict.

What this is: the one-glance version of how you run the seven-repo machine. It is a DERIVED digest, not an authority — on any conflict the planning docs and the Decision Deck win. Full detail: OPERATOR_MANUAL.md beside this file. Snapshot date: **2026-07-30**. Regenerate after any ruling that changes protocol.

1. The five golden rules

- **One repo per session.** Open the repo where the change will land. Game sessions keep the game + planning pair; planning/decision sessions start in planning.
- **Nothing ships that you didn't rule.** Agents implement; decisions are yours — chat one-liners and deck taps count immediately (Tier 1).
- **Feel is yours alone, and only rested.** Bots never judge feel. Dirty runs (god, slow-mo, runtime edits) stay PROVISIONAL no matter how good it felt at hour 14.
- **Everything between repos moves as a recorded event.** Packs travel by GitHub release + hash check. Needs become asks. Problems become incidents. Never hand-carry zips, never hand-edit an exported artifact.
- **Push before you stop.** Unpushed work on one machine is how the assembler drift happened. "Pushed" is verified, not assumed.

2. Starting any session

1. `tools/hourslog.ps1 start` — before ANY project work (code, art, design, planning — all of it).
2. Tell the agent the goal in a line or two. It reads the repo contract, checks the branch, and skims the sync log itself — that's its ritual, not yours.
3. If it flags a conflict with planning docs: that's a **stop**. Rule it in planning, never in the implementing repo.

3. Ending any session

1. The agent updates HANDOFF, appends sync-log entries for real cross-repo events, commits, pushes, and **confirms the push landed**. Your job: make sure it said so.
2. Deal any new deck cards it staged. If you tapped decisions in the deck app, EXPORT the JSON and hand it to the next session for the sweep.
3. `tools/hourslog.ps1 stop`.

4. Making decisions (the Decision Deck)

- **Tier 1:** your in-session calls (chat one-liners, deck taps) are decisions immediately.
- **Tier 2:** *feel* items additionally get ONE rested ratification pass before they're final.
- **"Rested" keys on YOUR day, not the clock.** You work 15:00–23:00 — home at midnight is your ~17:00, which is *not* rested. Day-start, fresh, clean build.

- Deck flow: open `tools/decision_deck.html` → PASTE FROM AI (append) → deal → decide (note optional) → EXPORT JSON → hand to the next session.

5. Recording verdicts in-game

Console (` key):

```
verdict <dodgeability|feel> <rested-human|bot-proof> <text>
```

- `feel` REJECTS bot sources by design — that's correct behavior.
- God mode, slow-mo, or a runtime edit auto-stamps later verdicts PROVISIONAL. Honor the stamp; re-record on a clean rested run.
- Dodgeability accepts {rested-human, bot-proof}. Feel accepts rested humans only.

6. Packs moving between repos (your part)

- Producers ship via **GitHub release**; the consuming agent verifies hashes before the drop touches anything. If origin can't be verified: refuse + incident — no exceptions, even from yourself.
- The sync-log app's top board answers the three questions: **deliveries waiting for intake / open problems / open asks**. Skim it, mark things resolved with a one-line note, EXPORT, commit (or tell the next agent).
- **Pins are deliberate**. A repo holding an older upstream version is a recorded choice. Never "helpfully" upgrade one without a ruling.

7. Playtesting law (quiet lab)

- Watched first-touches are **silent**: no coaching, no prompting, no explaining — you observe, never guide.
- CORE-54 evidence = **unprompted** quotes only (Discord/itch/feedback channels, verbatim). Debrief answers to your questions get marked "prompted". The in-build comments box never counts as CORE-54.
- **The Loop bar**: play THE LOOP daily. Fun for a week = the bar holds → only then schedule the 2–3 warm watched first-touches.

8. Weekly cadence (never skips)

- **One 30–60 s GIF** per week: G dumps the ring buffer → `tools/gif.ps1` → post to the devlog + one community.
- `tools/hours_report.ps1` weekly. A 4-week rolling average under 40 h/week triggers the PROD-01 floor reset and the slip ladder — by rule, not mood.

9. Keys (dev keyboard, no F-row)

Key	Does	Key	Does
Esc	pause (full freeze)	M	density meter
O	options / remap	H	hitbox display
I	interp A/B	T	reseed reset
[]	speed presets 3.0 / 4.0	`	debug console
G	GIF ring-buffer dump	Space	ability
R	replay dump		

10. Hard stops — call it, don't work around it

- Repo contradicts planning docs → stop; resolve in planning.
- Artifact origin unverifiable → refuse intake; incident entry.
- Branch deletion / force-push → **you click**, never an agent.
- Janitor sessions are mechanical only — merge conflicts and "which line wins" escalate to you.
- New protocol/tool/system idea → **talk-before-build**: walk it through in chat end-to-end, THEN say build.
- Never edit sim data while a battery runs. Never run gates while a Godot editor holds the same project open.

11. Open on you right now (2026-07-30 snapshot)

- **The rested feel pass** — formally closes M2 and ratifies the provisional bundle (six ordinaries, arenas, sphere set, audio-in-play).
- **THE LOOP**: play it; say the skeleton is "judgeable" to start the bar clock; judge every [T] rate (drop rates, XP growth, death cost 25%, king 900 HP, unique 35%).
- **b65 city walk verdict** (still unrecorded) + b71 overworld look.
- **Designer-eyes renders**: creation screen, drops/HUD, comments box, onboarding copy voice pass.
- **Eyes-closed audio pass** — now against the real Resonance Forge cues.
- **Weekly GIF** — loop/king material is fresh.
